Key Insights

1. Salary vs. Performance: A Paradox in Japan

- Across all markets, higher salaries correlate with lower performance scores — suggesting compensation alone does not drive output.
- Japan is the sole exception: it shows a strong positive salary-performance correlation, pointing to a culture of accountability and productivity worth replicating.

2. Declining Employee Salaries Since 2021

- Average employee compensation has fallen consistently since 2021. Without intervention, this trend risks talent attrition and reduced workforce morale across all regions.

3. Japan & China Lead on Cost Efficiency

- Japan records the second-lowest cost per unit after China, making the Asia-Pacific corridor the most cost-competitive manufacturing zone in the portfolio.

4. Automobile Sector Drives Highest Costs

- The automobile industry consistently outpaces all other sectors in average production cost. Cost optimisation initiatives should prioritise this vertical first.

5. Logistics: The Highest-Performing Department

- The logistics department holds the top global performance rating and also records the highest average employee tenure.
- Long tenure likely drives operational excellence — this department's management practices should be studied and scaled across other functions.

6. Sales Headcount: A Concentrated Bet on Key Markets

- Sales teams are most heavily staffed in markets outside Japan and China. This raises a strategic question: does headcount distribution align with where revenue and growth potential actually sit?

7. USA: High Salary, High Cost — A Direct Link

- The USA carries the highest average salary in the dataset and, correspondingly, the highest production costs.
- This correlation is the clearest evidence that labour cost is a primary driver of manufacturing expenses in the US market. Automation investment or nearshoring should be evaluated.
